

Amendments to the Specification:

Please replace the paragraph beginning on line 5 of page 10 in the Specification with the following amended paragraph:

The configuration of each of the respective straddling members is such that they are spaced apart a distance that is slightly greater than the distance between the medial and lateral angles of the eye. As such, upon application, one of the soft tissue of the eye and the straddling members must be flexed (i.e. manipulated) to achieve the desired registered positioning of the straddling members relative to the eye. Once positioned, the soft tissue is generally biased against the straddling members such that the two are retained in substantial abutment. This cooperation and respective dimensioning of components forms the biasing means 73 referred to in the claims as a means for biasing medial and lateral straddling members against the corner of the eye.
